Tandem mass spectrometry (MS-MS) is a related technology in which compounds are separated by molecular weight by one mass spectrometer, fragmented as. Tandem mass spectrometry (MS/MS) involves more than one-step of mass selection or analysis, and fragmentation is usually induced between the steps (9).

Mass Spectrometers. Tandem Mass Spectrometry (MS/MS). Mass spectrometers are commonly combined with separation devices such as gas chromatographs.

In tandem mass spectrometry a biomolecule of interest is isolated from a biological sample, and then fragmented into multiple subunits in order to help. Sample inlet, through which sample molecules are introduced into the mass spectrometer. • Source, where the molecules are converted to ions. • Mass analyser.

The tandem mass spectrometry is a vital technique in identifying and quantifying . Tandem mass spectrometry (MS/MS) offers additional information about specific ions. In this approach, distinct ions of interest are in a quadrupole filter based on . Tandem mass spectrometry can achieve specificities and sensitivities equivalent of those of methods such as radioimmunoassay and gas chromatography/mass. Metabolomics Research with Tandem Mass Spectrometry, Tandem Mass Spectrometry, Jeevan K. Prasain, IntechOpen, DOI: / Available from.

A tandem mass spectrometer comprises five basic components: an ion source, a mass analyzer (MS1), a collision chamber (also known as a collision cell).
